ANAND AGRICULTURAL UNIVERSITY (AAU)

Department of Plant Pathology - Groundnut Disease Advisory

1. Tikka Leaf Spot (Cercospora) and Rust Management

Groundnut Tikka disease produces circular dark brown to black spots with yellow halos on leaves, resulting in premature leaf shed. Management: At first appearance of spots (usually 35-40 days after sowing), spray Mancozeb 75% WP @ 30-35 grams per 15-liter pump or Hexaconazole 5% EC @ 25-30 ml per 15-liter pump. Repeat after 15 days if cloudy humid weather persists.

2. Collar Rot and Stem Rot (Sclerotium rolfsii)

Collar rot causes sudden seedling wilting with white mycelial growth and mustard-seed like sclerotia at the soil line. Bio-fungicide Treatment: Apply Trichoderma viride @ 50-60 grams per 15-liter pump around root zones or mix 2.5 kg Trichoderma with 500 kg well-decomposed farmyard manure (FYM) per acre prior to sowing. Avoid excessive irrigation that stagnates water around collars.
